In the new version of Elements, they have started creating "colours" which are essentially fixed palettes that you can mix and match. Photo editing software should be able to work with RAW uncompressed files, not those stored in compressed for-Windows data formats, and these colours just aren't the most efficient way of doing things. They just don't match up with Photoshop in terms of simplicity and speed. In the meantime I use Photoshop, because it was designed for professionals, not just hobbyists or amateurs. When you start adding layers and adjustment layers and curves you're working with a very different tool. On my iPad Pro, it's so fast and so simple to work on DSLR quality images that I find the iPad Pro is the best way to edit certain types of files. It's perfect for minimal use on very large files, especially if you use the app's raw editor. This further increases the market for digital imaging and along with it photography photography software has also risen in popularity.
